Extremely low resistance Output the final stages of amplifiers can effectively control, drive low impedance speakers even.

Inaugurated here was ACT (Audio Current Transfer) which uses current amplification to transfer signals from preamp to power amp stage and achieve 120 dB of dynamic range and outstanding levels of stereo separation.. High speed processing of these transistors optimum pulse rise times and, consequently, high fidelity reproduction of pulse signals.

High-fidelity transmission of pulse signals, large reserves of power and filtration (2x12000uf ELNA for AUDIO) power tips for preamp section (2x5600uf ELNA for AUDIO) and minimal distortion they give extremely clear sound, with a large dynamic and natural sound.. Nice poweramps, healthy power supply and the same phonoamp you find in every F4xxF5xxFA3 model.. Comments In poloczeniu special, carefully selected companies the power transistors (SANKEN) output signal distortion are reduced to a minimum.. The one reminiscence is the placement of the volume knob: left, just like the pre-Esprit and ESPRIT preamps, thus hinting that these amps also used the simple signal path inaugurated with the TA-E88B in 1976.. Reviewed Mar 08th, 2014 by Smoke Screen The last F5xxES with large Sanken BJT outputstages.. Basicly its a good amp for high level sources and decent for phono but its an afterthought compared to what was build in the age of JFETs..
